

DOM Manipulation in jQuery - Tasks

Task 1: Add and Remove Elements Dynamically

- Create an input field and a button.
- When the button is clicked, add the input text as a new `<li>` item in a `<ul>`.
- Each `<li>` should have a delete button to remove it.

Bonus: Use `.append()` and `.remove()` for dynamic manipulation.

Task 2: Change Text and Attributes

- Create a `<p>` with some text and a button.
- When the button is clicked, change the text of the `<p>`.
- Also, change the button text to indicate the change.

Bonus: Use `.text()`, `.html()`, and `.attr()` methods.

Task 3: Clone and Modify Elements

- Create a `<div>` with some text inside.
- Add a button that clones the `<div>` when clicked.
- Modify the cloned elements (e.g., change text color or add an index number).

Bonus: Use `.clone()` and `.css()` methods.

Task 4: Add and Toggle CSS Classes

- Create a `<div>` with some default text.
- Add a button that toggles a CSS class to change the background color.

Bonus: Use `.addClass()`, `.removeClass()`, and `.toggleClass()`.

Task 5: Form Input Value Manipulation

- Create a text input and two buttons: 'Uppercase' and 'Lowercase'.
- When clicked, convert the input text to uppercase or lowercase.

Bonus: Use `.val()` to get and set input values.
