

Event Handling in jQuery - Solutions

Solution 1: Click Event - Show/Hide Content

Use the `.click()` event to toggle content visibility.

HTML & jQuery Code:

```
<button id="toggleBtn">Toggle Content</button>
```

```
<div id="content" style="display:none;">Hello! This content is toggled.</div>
```

```
$(document).ready(function(){  
    $("#toggleBtn").click(function(){  
        $("#content").fadeToggle();  
    });  
});
```

Solution 2: Keypress Event - Live Character Counter

Use the `.on("input")` event to count characters in real-time.

HTML & jQuery Code:

```
<textarea id="textInput"></textarea>
```

```
<p>Character Count: <span id="counter">0</span></p>
```

```
$(document).ready(function(){  
    $("#textInput").on("input", function(){  
        let textLength = $(this).val().length;  
        $("#counter").text(textLength);  
        if (textLength > 50) {  
            $("#counter").css("color", "red");  
        } else {  
            $("#counter").css("color", "black");  
        }  
    });  
});
```

Solution 3: Hover Event - Change Background Color

Use the `.hover()` event to change background color.

HTML & jQuery Code:

```
<div id="hoverBox">Hover over me!</div>
```

```
$(document).ready(function(){  
    $("#hoverBox").hover(  
        function(){ $(this).css("background-color", "lightblue"); },  
        function(){ $(this).css("background-color", "lightgray"); }  
    );  
});
```
